<b>Job Market Paper</b>	<b>Powering the Future: The Long-Term Human Capital Effects of Rural Electrification</b>  <i>Abstract:</i> This paper examines the long-run human capital effects of a rural electrification program implemented in China in the late 1990s. The program simultaneously improved key factors of electricity delivery, making it a unique setting to study rural electrification at a time when delivery failures remain pervasive in many low- and middle-income countries and empirical evidence is scarce. I first develop a simple model of human capital investment in which electrification represents a productivity shock in agriculture. The model implies that the effect on children's long-run human capital is theoretically ambiguous. I then examine these implications empirically using a cohort difference-in-differences design, with treatment intensity measured by county-level electricity price reductions. I find that exposure to the program during middle childhood (ages 6 to 11) leads to large long-run gains in human capital. In contrast, exposure only after middle childhood yields negative and statistically insignificant effects. I also find evidence that improved agricultural productivity is an important mechanism, consistent with both the model and existing literature. My paper explains why the effects differ by age at exposure. China's experience in the late 1990s offers insights for rural electrification efforts in developing countries today.
